Za kolegij

Experimental Antibody Development

Studij:	Medical Studies in English (R) (izborni) Sveučilišni integrirani prijediplomski i diplomski studij
Katedra:	Centar za proteomiku
Nositelj kolegija:	prof. dr. sc. Lenac Roviš Tihana
Godina studija:	5
ECTS:	1.5
Stimulativni ECTS:	0 (0.00%)
Strani jezik:	Mogućnost izvođenja na stranom jeziku

Podaci o kolegiju:

Course Overview:

The elective course on advanced topics in immunology and antibody development is designed to provide fifth/sixth-year medical students with a comprehensive understanding of immunization processes and the development of monoclonal antibodies. The course explores cutting-edge techniques and applications in antibody research and immunotherapy. Students will have the opportunity to engage in hands-on laboratory exercises and seminars, enabling them to gain practical experience and contribute to the advancement of immunotherapy research.

The course is intended primarily for students who are oriented towards molecular medicine and branches that include immunology, infectology, microbiology, oncology, pathology, pharmacology, molecular diagnostics, etc.; also to those students who want to understand the molecular basis on which the processes of immunization and antibody production are based, such as future epidemiologists and experts involved in vaccine development. The aim of the course is to integrate acquired theoretical knowledge from immunology and infectology using examples and to empower the student in experimental work in the laboratory using the example of the development of monoclonal antibodies to a protein antigen.

Course Structure:

L1 (1h) Introduction to immunization processes and the production of proteins as immunogens

L2 (2h) The process of producing monoclonal antibodies using the hybridoma technique and the phage display technique

L3 (1h) Recombinant antibodies, protein-based vaccines and vaccines using proteins as carriers

L4 (2h) Development of antibodies for the needs of immunotherapy with examples of own patents in the immunotherapy of tumors (1h) and viruses (1h)

Exercises (14 h): The maximum number of students is limited to three due to the experimental nature of the course and the use of several scientific laboratories. The exercises will include 14 hours of experimental work with supervision of procedures involved in the development and characterization of murine monoclonal antibodies, including but not limited to: BCA assay of immunogen concentration in a sample; ELISA assay of supernatant of hybridoma cell lines (1/3 of 96-well plate) for immunogen of interest; test of positive supernatants of hybridoma cell lines to identify native immunogens by immunofluorescence or flow cytometry or immunoblotting method - exercises are adapted to current laboratory activities.

Seminars (5h): Presentations of the students' experimental results in the form of a report which, in addition to the achieved results, will contain a short theoretical introduction to the research problem and the possibility of exploiting the antibodies in the development of which they participated.

Popis obvezne ispitne literature:

Selected review, scientific or applicative papers related to an individual experimental task (immunogen of interest)

Popis dopunske literature:

Nastavni plan:

Predavanja popis (s naslovima i pojašnjenjem):

L1 (1h) Introduction to immunization processes and the production of proteins as immunogens

The student will be able to:

1. Applies knowledge of molecular and cellular mechanisms that are important in the process of immunogen preparation and immunization.

L2 (2h) The process of producing monoclonal antibodies using the hybridoma technique and the phage display technique

The student will be able to:

Defines the steps in the production of monoclonal antibodies
Discusses the merits of different methods for obtaining antibodies

L3 (1h) Recombinant antibodies, protein-based vaccines and vaccines using proteins as carriers

student will be able to:

1. Defines the concept of recombinant antibody and subunit (protein) vaccine
2. Describe the reasons for using proteins as a carrier in vaccine development

L4 (2h) Development of antibodies for the needs of immunotherapy with examples of own patents in the immunotherapy of tumors (1h) and viruses (1h)

The student will be able to:

Discuss some current principles of immunotherapy
Describe the concept of antibody-based intellectual property

Vježbe popis (s naslovima i pojašnjenjem):

E1 (5h). Hybridoma technique, ELISA-analysis

Exercises (14 h): The maximum number of students is limited to three due to the experimental nature of the course and the use of several scientific laboratories.

The student will be able to:

Create a plan for the rational selection of laboratory tests and the interpretation of their results for the validation of antibodies used in medicine.

0-7 hours: The exercise will include 7 hours of experimental work under supervision, focusing on procedures involved in the development and characterization of murine monoclonal antibodies. This includes performing ELISA assays on the supernatants of hybridoma cell lines to detect the immunogen of interest (in 2024: DNAM-1; 2h sample preparation + 5h analysis).

8-14 hours: The exercise will include 7 hours of experimental work under supervision, focusing on testing positive supernatants from hybridoma cell lines to identify native immunogens using methods such as immunofluorescence, flow cytometry, or immunoblotting (in 2024: flow cytometry, human peripheral blood mononuclear cells 5h (3h sample preparation + 2 h analysis) + Immunohistochemistry 2h).

E2 (3h). Validation Technique for Selected Developed Antibodies - Flow Cytometry-preparation

Exercises (14 h): The maximum number of students is limited to three due to the experimental nature of the course and the use of several scientific laboratories.

The student will be able to:

Create a plan for the rational selection of laboratory tests and the interpretation of their results for the validation of antibodies used in medicine.

0-7 hours: The exercises will include 7 hours of experimental work under supervision, focusing on procedures involved in the development and characterization of murine monoclonal antibodies. This includes performing ELISA assays on the supernatants of hybridoma cell lines to detect the immunogen of interest (in 2024: DNAM-1).

8-14 hours: Testing positive supernatants from hybridoma cell lines to identify native immunogens using methods such as immunofluorescence, flow cytometry, or immunoblotting (in 2024: flow cytometry, human peripheral blood mononuclear cells 5h + Immunohistochemistry 2h).

E3 (2h). Validation Technique for Selected Developed Antibodies - Immunohistochemistry

Exercises (14 h): The maximum number of students is limited to three due to the experimental nature of the course and the use of several scientific laboratories.

The student will be able to:

Create a plan for the rational selection of laboratory tests and the interpretation of their results for the validation of antibodies used in medicine.

0-7 hours: The exercises will include 7 hours of experimental work under supervision, focusing on procedures involved in the development and characterization of murine monoclonal antibodies. This includes performing ELISA assays on the supernatants of hybridoma cell lines to detect the immunogen of interest (in 2024: DNAM-1).

8-14 hours: Testing positive supernatants from hybridoma cell lines to identify native immunogens using methods such as immunofluorescence, flow cytometry, or immunoblotting (in 2024: flow cytometry, human peripheral blood mononuclear cells 5h + Immunohistochemistry 2h).

E2b (2h). Validation Technique for Selected Developed Antibodies - Flow Cytometry-analysis

E1 (2h) ELISA sample preparation

Exercises (14 h): The maximum number of students is limited to three due to the experimental nature of the course and the use of several scientific laboratories.

The student will be able to:

Create a plan for the rational selection of laboratory tests and the interpretation of their results for the validation of antibodies used in medicine.

0-7 hours: The exercise will include 7 hours of experimental work under supervision, focusing on procedures involved in the development and characterization of murine monoclonal antibodies. This includes performing ELISA assays on the supernatants of hybridoma cell lines to detect the immunogen of interest (in 2024: DNAM-1; 2h sample preparation + 5h analysis).

8-14 hours: The exercise will include 7 hours of experimental work under supervision, focusing on testing positive supernatants from hybridoma cell lines to identify native immunogens using methods such as immunofluorescence, flow cytometry, or immunoblotting (in 2024: flow cytometry, human peripheral blood mononuclear cells 5h (3h sample preparation + 2 h analysis) + Immunohistochemistry 2h).

Seminari popis (s naslovima i pojašnjenjem):

Seminars (4+1 hours): Results Presentation, 4 h Online Sessions & 1 h In-person

Ishodi učenja

Seminars (4+1h): Presentations of the students' experimental results in the form of a report which, in addition to the achieved results, will contain a short theoretical introduction to the research problem and the possibility of exploiting the antibodies in the development of which they participated.

Obveze studenata:

regular attendance of classes (lectures, seminars, exercises)

preparing a seminar /passing the final exam

Ispit (način polaganja ispita, opis pisanog/usmenog/praktičnog dijela ispita, način bodovanja, kriterij ocjenjivanja):**Ostale napomene (vezane uz kolegij) važne za studente:**

The maximum number of students is limited to three due to the experimental nature of the course and the use of several scientific laboratories.
